# Feature enhancements

This section provides information on the following enhancements in the latest FrameMaker (2015 release) update 4.

## Adobe Experience Manager connector enhancements

### **New Review Comments pod to track and manage review comments**

You can now sync, view and reply to review comments received on a topic using the new Review Comments pod in FrameMaker. An author initiates a review task for a single topic or multiple topics from the Adobe Experience Manager (AEM) interface. Multiple reviewers can review the topics and provide review comments. They can also view comments given by other reviewers in real-time and post replies.

The Review Comments pod in FrameMaker gives a consolidated list of all review comments to the author to fix. From the Review Comments pod, you can:

- Filter comments by choosing a specific reviewer or all reviewers
- Mark the status for each comment. You can choose from None, Accepted or Rejected
- See all comments by clicking on Show All comments
- Post a reply for a comment

*Note: The Review Comments pod shows comments only for the topics shared for review. If you have shared a DITA map for review, comments on the DITA map can only be viewed in the XML Documentation Add-on for Adobe Experience Manager interface.*

### **Support for HTTPS**

HTTPS uses Secured Socket Layer (SSL) to exchange information between a client and a server. You can now use HTTPS to establish a connection between FrameMaker and AEM.

### Integrated search with XML Documentation Add-on for AEM

FrameMaker's repository search is now seamlessly integrated with AEM. If you use the repository search feature in FrameMaker, the search is performed in the DITA content within the AEM repository. For this feature to work, your AEM server must have the XML Documentation Add-on installed. The results are displayed in the Repository Search pod in FrameMaker. Using the Repository Search pod, you can perform regular file functions on the search results, such as open or explore a topic.

The repository search functionality also comes with an added attribute search feature. You can search the DITA content by text, and also by an element's attribute in FrameMaker. Perform attribute search using appropriate values in **Attribute name = Value** format.

### New Adobe Experience Manager options in the Preferences dialog

The Preferences dialog box is updated to include configurable options for Adobe Experience Manager connector. You can use these options to set up file check-in and check-out preferences for AEM. Go to Edit > Preferences > CMS > Adobe Experience Manager to see the updated preferences.

### Connection Manager dialog enhancements

- *Alphabetically organized list of connectors*

The list of connectors in the Connection Manager dialog is organized alphabetically. You can now easily look for the connector while setting up a connection and choose the one that is required.

- *Option to browse and update the location for Local Folder*

FrameMaker creates a local download folder that acts as a temporary location on your machine. You can download files from AEM into this Local Folder. The default location of the Local Folder is **C:\Users\\Documents**. However, you can change this location by clicking on the Browse button given alongside the Local Folder field.

- *Option to save and remember connection password*

You have an option to save the connection password while setting up a new connection. Enter the connection password and select the Save Password option. FrameMaker remembers the password when you re-connect after your first successful attempt.

### Repository Manager window enhancements

- *New Review Comments pod launch icon*

Repository Manager has an enhanced user experience. It includes a new Review Comments pod icon. Click this icon to quickly launch the Review Comments pod that facilitates easy management of the review comments.

- *Repository Manager context menu enhancements*

After you set up a connection with a repository, the contents are organized in the form of files and folders in the Repository Manager window. You can perform a set of functions on these files and folders. The list of these functions has been enhanced and re-organized to provide seamless experience.

For more information about the functions that you can perform, see *Working with files* section in the *Content Management Systems* chapter of the Adobe FrameMaker (2015 release) User Guide.

## User interface enhancements

The following enhancement has been made in the latest user interface:

- *Organized list of items in the Format menu*

Earlier when you clicked *Format > Fonts* (Characters or Paragraphs), a list of fonts installed on your system was displayed in a multi-column layout. If you had a long list of fonts on your system, the list would cover up the whole FrameMaker user interface. Now, when you click *Format > Fonts* (Characters or Paragraphs), the list of items is neatly organized in a single column. If the list is long, you can use the up and down scroll icons to easily traverse the list of items.

# Issues resolved

This section provides information on the following issues resolved in the latest FrameMaker (2015 release) update 4.

1. When connected to the AEM server, if the file has unresolved cross-references or text insets, it fails to check-in.  
(Ref - **4166507**)
2. When setting up a Fm-AEM connection over VPN, the connection fails.  
(Ref - **4160478**)
3. While creating or updating a standalone TOC for an unstructured document in structured mode, the information for generating the TOC file is lost. As a result, an empty file is generated. This is also applicable for generating a list of figures, tables, and paragraphs.  
(Ref - **4155655**)
4. When you try to import or export an EDD file for an Arabic document, the settings are not replicated correctly.  
(Ref - **4152183**)
5. In FrameMaker, if you checkout, edit, and save the file and then try to check-in the same file, you are prompted to save the file again.  
(Ref - **4158932**)
